

SUMMARY

I recently graduated from the UT Full-Stack Web Development course, and I'm looking for any sort of web developer position to put my newly acquired skills into practice! I have always had a passion for computing and programming, and have also been working on some Unity projects in my spare time to keep my creative juices flowing. I am dedicated to learning new skills and technologies and would love an opportunity to prove this to any potential employer!

TECHNICAL SKILLS

Languages: JavaScript, CSS, HTML, C++, C#, Python
Databases: MySQL, MongoDB
Tools: Git, Heroku, React, Node, Express
API: REST, GraphQL
Other: Adobe Premiere, Unity, Unreal 4, Photoshop

PROJECTS

Parktime 2 - [Github](#) - [Website](#)

Summary:

Parktime was one of the first group projects I worked on during the UT webdev bootcamp. It's a national park finder, which when given an address (or you can use your current location) will find, sort, and display a list of the closest national parks in the USA! You could see all the features and activities the parks had, as well as get current weather info and directions. It also had functionality for users to sign up, favorite parks into their own list, and leave comments.

My role:

I worked closely with my two other group members on almost everything (like the API creation, front end styling, routes and models etc), but I specifically came up and worked on the logic for pagination, as well as the favorite parks functionality.

Used:

HTML, CSS, Javascript, JQuery, Iconic, National Park API, Geoapify API, Google maps API, OpenWeather API, Express, Sequelize, bcrypt

PET PLANiT - [Github](#) - [Website](#)

Summary:

Pet Planit was the final project due for the UT webdev bootcamp. It's a social media website centered around pets and animals! Users could sign up and make posts in various categories, add and remove pets from their profile, check out other peoples profiles, and respond to any posts or comments left by other users.

My role:

For this project I mainly spearheaded the profile page, which included all the code and logic for adding/removing pets (including the DB calls), and updating the profile information. I also was able to get a profile image / pet image uploading system working using the Imgur API (so we wouldn't have to host the images ourselves)

Used:

HTML, CSS, JavaScript, React, JQuery, MongoDB, Mongoose, Express, bcrypt, Imgur API, faker, GraphQL, Jsonwebtoken

EXPERIENCE

Technical Support Analyst & Product Tester

June 2016 – Jan 2020

Clutch Analytics

Austin, TX

(part-time)

- Providing application support to Insurance Agents
- Testing for Clutch's software product releases
- Assisting Clutch staff with IT support and AV setup
- Became the official video editor for the entire company making training videos for agents

Server

September - October 2014

Chipotle Restaurant

Austin, TX

(full-time)

- Food preparation
- Customer service

EDUCATION

Certificate of Completion for Full-Stack Web Development

October 2021

The University of Texas at Austin

Certificate of C++ Programming

December 2016

Austin Community College

High School Diploma (Equivalent)

Canberra College Australia

December 2014

Availability to start
